Using Python to create a simple Weather App

```
#Install required library:
#pip install requests

import requests

#Enter your API key
api_key = "YOUR_API_KEY"

#Get city name
city = input("Enter city name: ")

#API URL
url =
f"https://api.openweathermap.org/data/2.5/weather?q={city}&appid={api_key}&
units=metric"

#Get weather data
response = requests.get(url)
data = response.json()

# Display weather
if response.status_code == 200:
    temperature = data["main"]["temp"]
    weather = data["weather"][0]["description"]

    print("\nWeather Report")
    print("City:", city)
    print("Temperature:", temperature, "°C")
    print("Condition:", weather)

else:
    print("City not found!")
```
